

## Alert from the NDEWS Web Monitoring Team: Online mentions of Tucibi

**What was found?** Analysis of online discussions indicates a significant increase in interest and activity related to 2-MMC. Discussion activity has been on the rise since June and is currently at an all-time peak. This surge in online conversations about 2-MMC suggests a growing awareness and potentially increased use of the substance, which could have implications for public health monitoring and intervention strategies.

**What is 2-MMC?** 2-Methylmethcathinone (2-MMC) is a substituted cathinone derivative that is closely related to other stimulant drugs such as 3-methylmethcathinone and 4-methylmethcathinone (mephedrone). 2-MMC is a recreational designer drug with stimulant and euphoric effects.

**How is it being discussed?** Reddit users describe 2-MMC as a mild stimulant with significant euphoria when taken orally, while intranasal administration is reported to result in weak classical cathinone stimulation and euphoria. Some commenters mention pairing low doses of 2-MMC with psychedelics. Discussants report feeling less negative after-effects the next day compared to substances like 4-MMC, 3-MMC, or 3-CMC. Reddit users warn about strong potential for addiction, psychological effects of serotonin depletion, potential long-term neurological damage, and they caution against ingesting 2-MMC more than once a week.

**Drug Terms Searched:** 2-MMC, 2-Methylmethcathinone, ortomephedrone.
