

## Alert from the NDEWS Web Monitoring Team: Online mentions of 5-MeO-DiPT

**What was found?** Analysis of online discussions indicates that interest in and use of 5-MeO-DiPT has increased in an erratic but rising manner over the past 9 years. The most recent spike in discussion of the drug has been progressing since early 2024.

**What is 5-MeO-DiPT?** 5-MeO-DiPT, also known as "Foxy" or "Foxy Methoxy", is a synthetic psychedelic tryptamine drug. It is the methoxy derivative of diisopropyltryptamine (DiPT). According to our [Rapid Street Reporting](#) survey, between November 2021 and November 2023, only 6 participants reported use in the last 12 months out of 6,122 people surveyed

**How is it being discussed?** Reddit users report that 5-MeO-DiPT produces effects similar to MDMA at low doses and intense hallucinations at higher doses. It is often mentioned as a sex enhancer. 5-MeO-DiPT has a reputation as an intense, and unique psychedelic. Commenters frequently warn that 5-MeO-DiPT has a very steep dose-response curve, where even small dosage increases can intensify effects dramatically.

Many Reddit users report an uncomfortable body load on 5-MeO-DiPT, including nausea, vomiting, agitation, and a "weird" physical sensation. The onset of action is described as slow, leading some Reddit users to mistakenly re-dose and end up with an overly intense experience. At high doses, some commenters report excessively low blood pressure or elevated heart rate

**Drug Terms Searched:** 5-MeO-DiPT, Foxy, Foxy Methoxy
